## 开始场景分析:

```
#region 3、开始场景逻辑
1 个引用
static void BeginScene(int w, int h, ref E_SceneType nowSceneType)
                                                  用于给外部场景设置
   Console. SetCursorPosition(w / 2 - 3, 8);
   Console. Write("飞行棋");
   int curPos = 1;
   bool isExitScene = false;
   ConsoleColor consoleColor;
   //开始场景逻辑处理循环
   while (true)
       Console.SetCursorPosition(w / 2 - 4, 13);
       consoleColor = curPos == 1 ? ConsoleColor.Red : ConsoleColor.White;
       Console.ForegroundColor = consoleColor;
       Console. WriteLine("开始游戏");
       Console. SetCursorPosition(w / 2 - 4, 15);
       consoleColor = curPos == 0 ? ConsoleColor.Red : ConsoleColor.White;
       Console. ForegroundColor = consoleColor;
       Console. WriteLine("退出游戏");
       switch (Console. ReadKey(true). Key)
           case ConsoleKey. W:
           case ConsoleKey. S:
               curPos ^= 1;
               break;
           case ConsoleKey. J:
               if (curPos == 1)
                  nowSceneType = E_SceneType.Game;
                   isExitScene = true;
                  Environment. Exit(0);
               break;
       if (isExitScene)
           break; 退出大循环
#endregion
```
