6: 搬砖工人类随机创建砖块

```
namespace 俄罗斯方块
    class BlockWorker: IDraw
       private List(DrawObject> blocks;
        private Dictionary(E_DrawType, BlockInfo) blockInfoDic;
        private BlockInfo nowBlockInfo;
            blockInfoDic = new Dictionary < E_DrawType, BlockInfo>()
                {E_DrawType.Cube, new BlockInfo(E_DrawType.Cube) },
                {E_DrawType. Line, new BlockInfo(E_DrawType. Line) },
                {E_DrawType. Tank, new BlockInfo(E_DrawType. Tank) }, 
{E_DrawType. Left_Ladder, new BlockInfo(E_DrawType. Left_Ladder) },
                {E_DrawType.Right_Ladder, new BlockInfo(E_DrawType.Right_Ladder) },
                {E_DrawType.Left_Long_Ladder, new BlockInfo(E_DrawType.Left_Long_Ladder) },
                {E_DrawType.Right_Long_Ladder, new BlockInfo(E_DrawType.Right_Long_Ladder) },
            RandomCreateBlock();
       //summary
1个引用
        public void RandomCreateBlock()
           E_DrawType type = (E_DrawType)random.Next(1, 8); 有7中类型,但是围墙不算在内
               new DrawObject(type),每次出现的方块都是4个小方形组成的,不管哪一种类型方块new DrawObject(type),都是4个
DrawObject(type),都是4个
DrawObject(type)
                new DrawObject(type),
            blocks[0].pos = new Position(24, 5); <mark>暂时设置原点后续</mark>
//其他三个方块的位置
//需要取出当前方块的形态,在进行随机取出变形后的方块
            nowBlockInfo = blockInfoDic[type];
            //不能随机0,4因为Cube类型方块只有一个数组元素,其他的都有4个数组元素
int index = random.Next(0, nowBlockInfo.Count);//在当前类型下的方块中,随机一种变形后的状态
            Position[] nowPos = nowBlockInfo.list[index];
            for (int i = 0; i < nowPos.Length; i++)
                 //取出来的pos是独立的点,需要转换成相对原点的坐标
                blocks[i + 1].pos = nowPos[i] + blocks[0].pos;
        public void Draw()
            for (int i = 0; i < blocks. Count; i++)
               blocks[i]. Draw();每一个元素都是一个DrawObject类,是一个最小单元的方形,draw就是根据自己的位置绘制在控制台上
```

```
回namespace 俄罗斯方块
    2 个引用
    class GameScene : ISceneUpdate
                   游戏场景添加工具人类
       Map map;
       BlockWorker worker;
       1 个引用
       public GameScene()
          map = new Map();
          worker = new BlockWorker();
       2 个引用
       public void upData()//游戏界面(主要的逻辑处理更新)
          //地图更新绘制//每一帧都绘制一次
          map. Draw();
          //绘制砖块
          worker. Draw();
```

每次运行,都是随机的方块
