玩家结构体和枚举

```
#region 8、玩家枚举和结构体
enum E_PlayType
   Player,
   Computer,
struct Player
   public B_PlayType type;
// 这里我们不知道xy的位置,但是我们知道格子对象是带有xy的
//所以我们只需要记录格子的下标索引 作为玩家的位置就很好
   public int index;
   public Player(int index, E_PlayType type)
       this. index = index;
       this.type = type;
   //绘制方法
   public void Draw (Map map)
       //从传入的map中找到index下标的格子,就是我们玩家当前的位置
       Grid grid = map.grids[index];
       //找到位置,并修改为玩家的颜色,画出玩家即可,
       Console. SetCursorPosition(grid.pos.x, grid.pos.y);
       switch (this. type)//判断是玩家还是电脑,他们都是用的这个结构体
           case E_PlayType.Player:
               Console. ForegroundColor = ConsoleColor. Cyan;
               Console. Write ("☆");
               break:
           case E_PlayType.Computer:
               Console. ForegroundColor = ConsoleColor. DarkMagenta;
               Console. Write ("▲");
               break;
           default:
               break;
#endregion
```

思想:就是设置一个枚举和结构体,枚举就是玩家和电脑,结构体是公用的。属性一致,添加了draw自己的方法,跟格子类一样。这里我们会根据类型判断取画自己的图形。把重合的逻辑单独写一个函数来封装这个draw函数:

```
#region 9、绘制玩家(存在重合)
1 个引用

static void DrawPlayer(Player player, Player computer, Map map)
{
    //重合时:
    if (player.index == computer.index)
    {
        Console.SetCursorPosition(map.grids[player.index].pos.x, map.grids[player.index].pos.y);
        Console.ForegroundColor = ConsoleColor.Green;
        Console.Write("②");
    }
    else //不重合, 就画自己的
    {
        player.Draw(map);
        computer.Draw(map);
    }
}
#endregion
```

output:

不重合

```
#region 4、游戏场景逻辑
static void GameScene(int w, int h, E_SceneType nowSceneType)
                                                      M D:\ProJect\C#\Csharp_1\飞行棋\bin\D
   //绘制墙体
                                                        DrawWall(w, h);
   //绘制地图,初始化一张地图
   Map map = new Map(14, 3, 90);
                                                                map. Draw();
                                                                 \square \infty \square \oplus \square \infty \square \infty
                                                                 Player player = new Player(0, E_PlayType.Player);
   Player computer = new Player(1, E_PlayType.Computer);
                                                                \infty
   DrawPlayer(player, computer, map);
                                                                while (true)
```

展示重合:

```
map. Draw();

//绘制玩家
Player player = new Player(0, E_PlayType. Player);
Player computer = new Player(0, E_PlayType. Computer);
DrawPlayer(player, computer, map);

while (true)
{
```
